EXPERIMENT-1

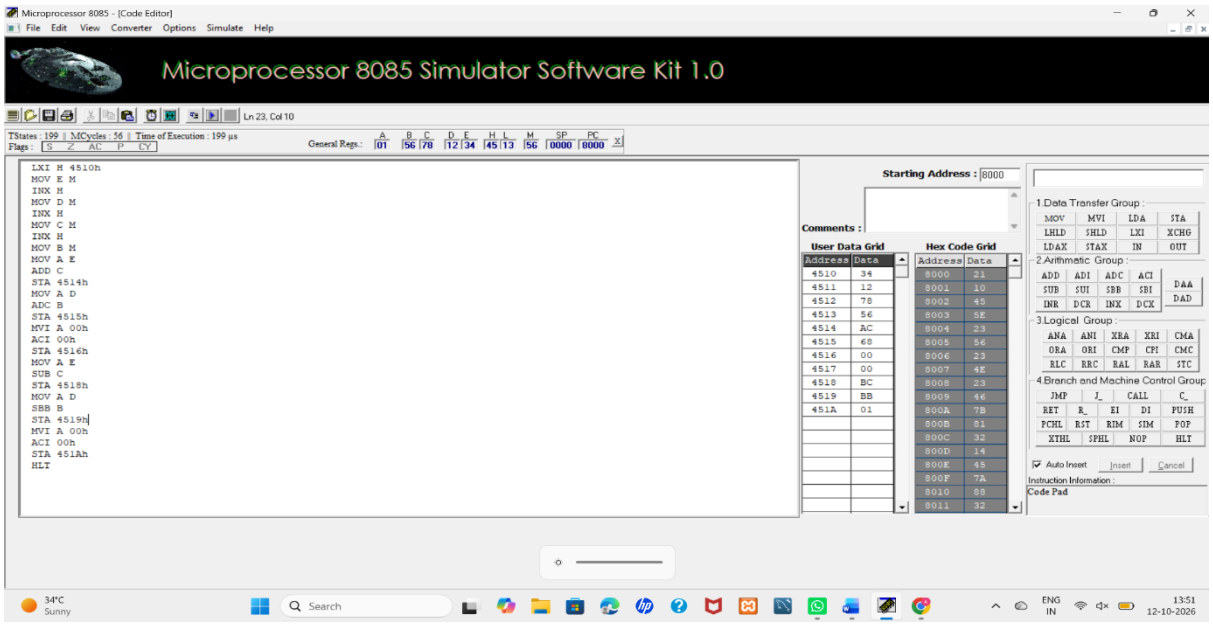

1(a). AIM: To perform 8-bit addition and subtraction of two numbers 9CH and 7AH using the 8085 microprocessor, store the sum, carry, difference, borrow, and flag register values in the specified memory locations.

OUTPUT:

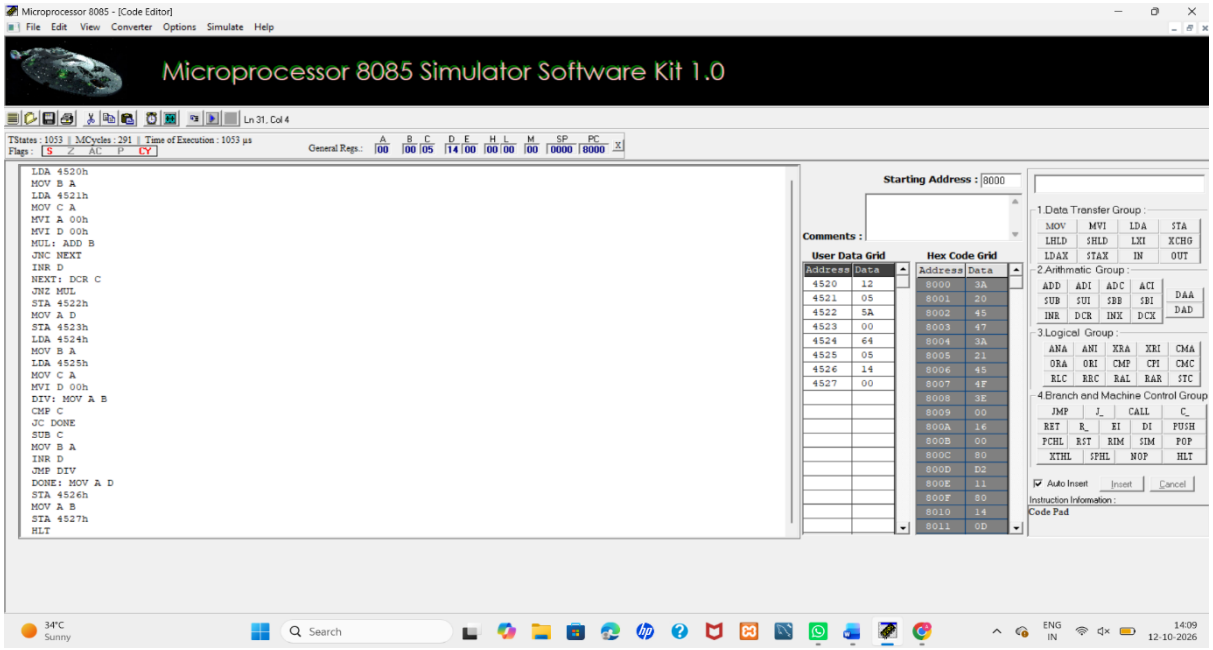

1(b). AIM: To perform 16-bit addition and subtraction of two numbers, (X = 1234H) and (Y = 5678H), using the 8085 microprocessor and store the sum, carry, difference, and borrow in the specified memory locations.

OUTPUT:

1(c). AIM: To perform 8-bit multiplication and division using the 8085 microprocessor by repeated addition and repeated subtraction, and store the product, quotient, and remainder in the specified memory locations.

OUTPUT:

1(d). AIM: To perform 16-bit multiplication and division using the 8085 microprocessor and store the 32-bit product, quotient, and remainder in the specified memory locations, then verify (N = Q \times \text{divisor} + R).

OUTPUT:
